

Static Vent

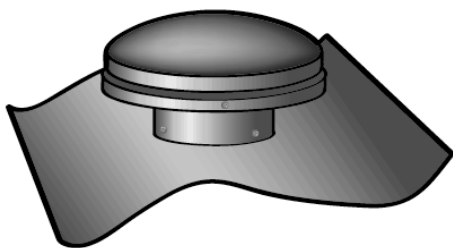

The Roof Space Breather Valve

The 150mm Roof Valve is a low profile static roof ventilator that allows nominal ventilation of hot or moist air from the roof space, with out the need of wind or power assistance.

Its low profile dome make it an attractive addition to any roof whether it is mounted near the ridge or on the lower edges of the roof.

The Roof Valve is also available with a clear dome. This allows the unit to not only be used as a ventilation point but also for providing a natural source of light for attic spaces.

The unit is constructed from long life, UV stabilised and impact resistant ABS polymer. It comes complete with an aluminium flashing. That makes the unit very easy to install on tiled or metal roofs.

The Static Vent has a wide variety of applications:

- As an air replenishment point for roofs with sarking and small or no eaves.
- As an exhaust vent when the unit is fitted above a ceiling exhaust fan.
- For air intake or exhaust from air conditioning systems mounted in the roof.
- To provide nominal ventilation for a hot or moist roof space.
